

香港紡織及成衣研發中心  
The Hong Kong Research Institute of  
Textiles and Apparel

# Open Lab

# Why build a factory in one of the world's most crowded, most expensive city?

# About Open Lab

→ Our mission is to support the fashion and textile industry to combat climate change by contributing to problem-solving, showcasing solutions, and providing a platform for industry-wide collaboration.

→ achieved by:

✓ **SCALE through collaboration**

- scale and commercialize solutions through multi-stakeholder partnerships and business model integrations

✓ **INNOVATE at speed**

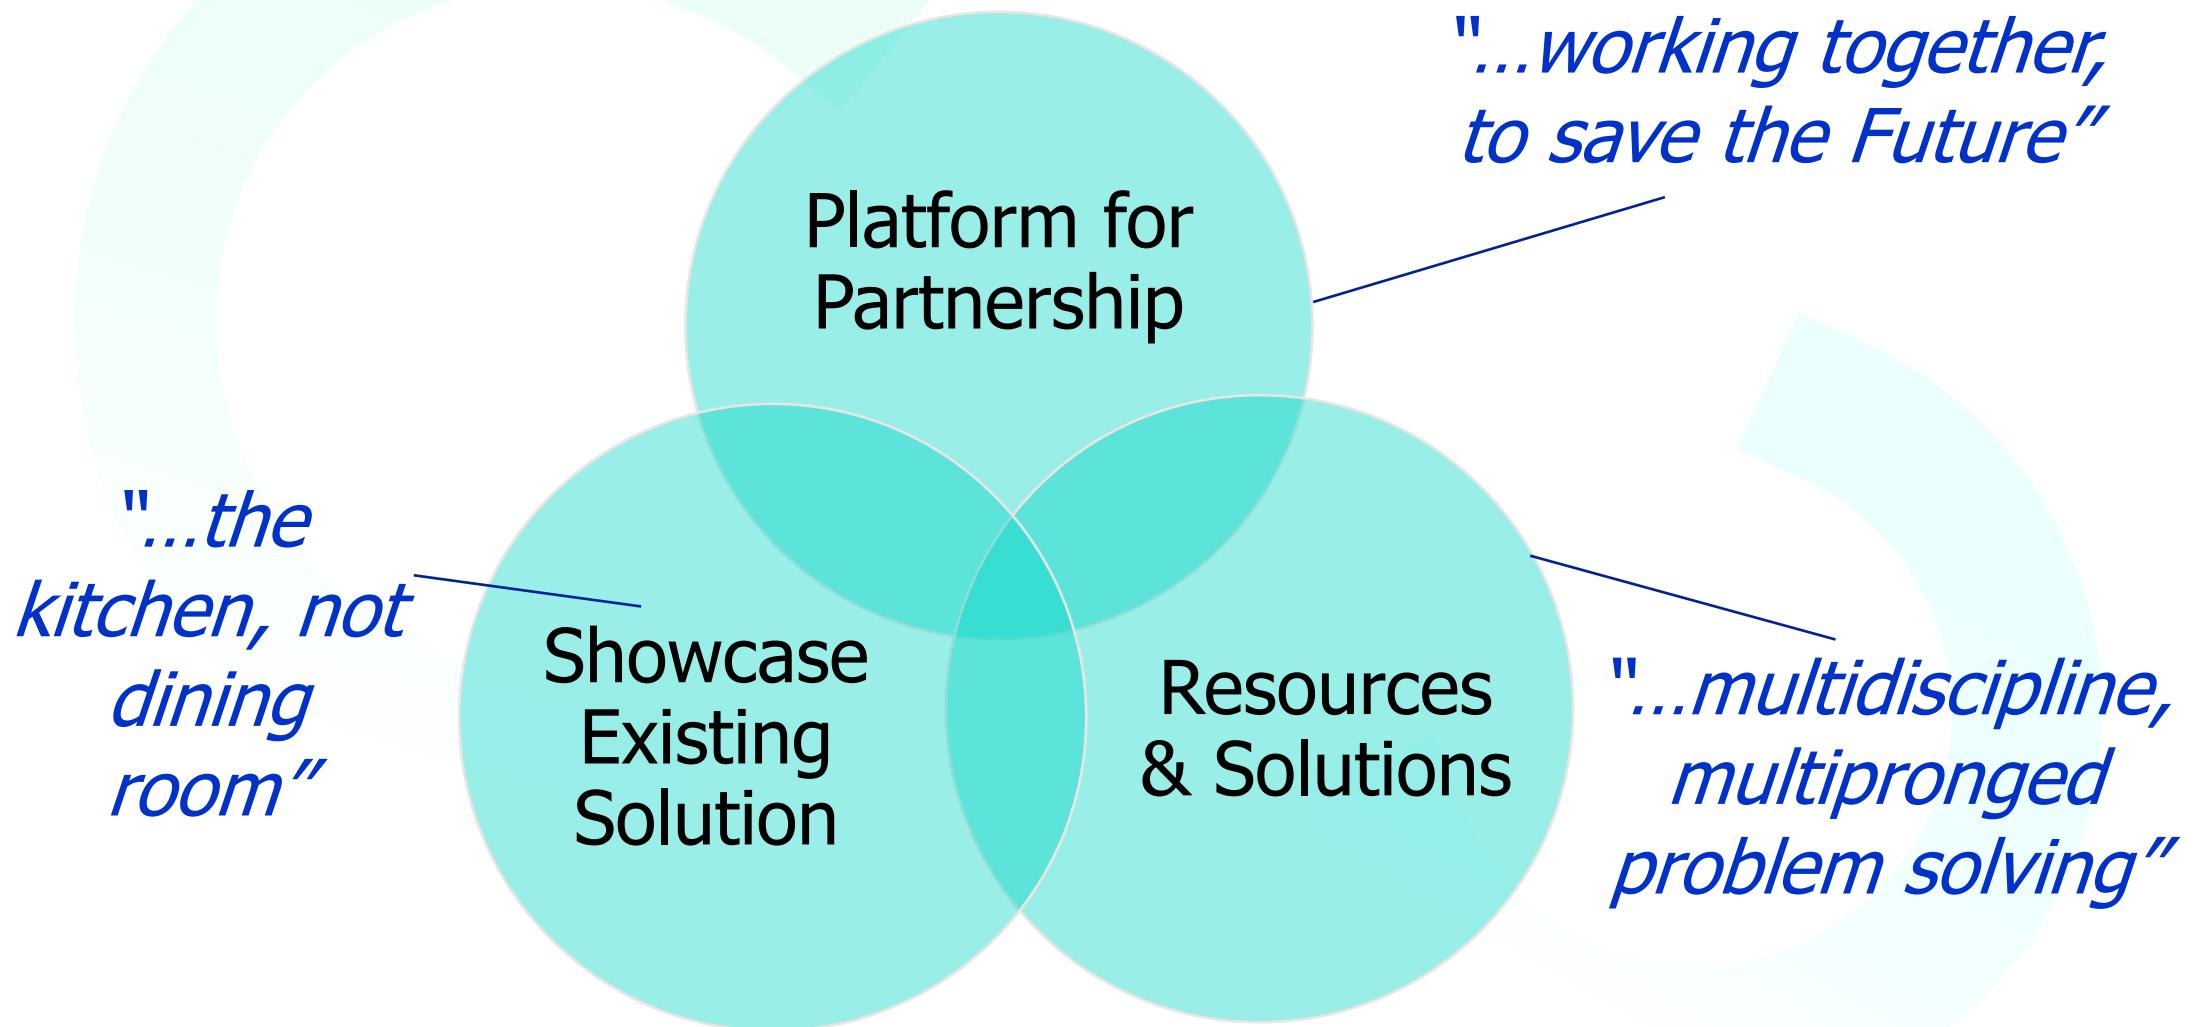

- conduct R&D projects at speed through rapid iteration to identify disruptive and bold innovations

✓ **INSPIRE to impact**

- drive industry-wide change and inspire action through proof of concepts, prototypes and live demonstrations

# Addressing climate change through Open Lab

# Open Lab: Partnership & Collaboration Platform

→over 80 projects, spanning a wide range of textile sustainability topics.

→These include,

- Renewable & recycled Materials
- Environmental-friendly Treatment
- Energy & Water Saving Manufacturing
- GHG & Carbon Negative Solution
- Green Materials & Process
- Organic Materials & Biodiverse Practices

In 2020, the Hong Kong Research Institute of Textiles and Apparel (HKRITA) and the R&M Foundation committed to a five-year collaboration plan under the theme "Planet First" to further drive the sustainable developments for the textile and fashion industry. Open Lab is one of the initiatives of "Planet First". It does not only support the industry to be more planet-positive, but also to facilitate industry collaborations to scale solutions and impacts.

**INNOVATE** at speed: carry out researches  
**SCALE** through collaboration: leverage scalable solutions through partnerships and business model integration  
**MAXIMISE** impact: drive industry change

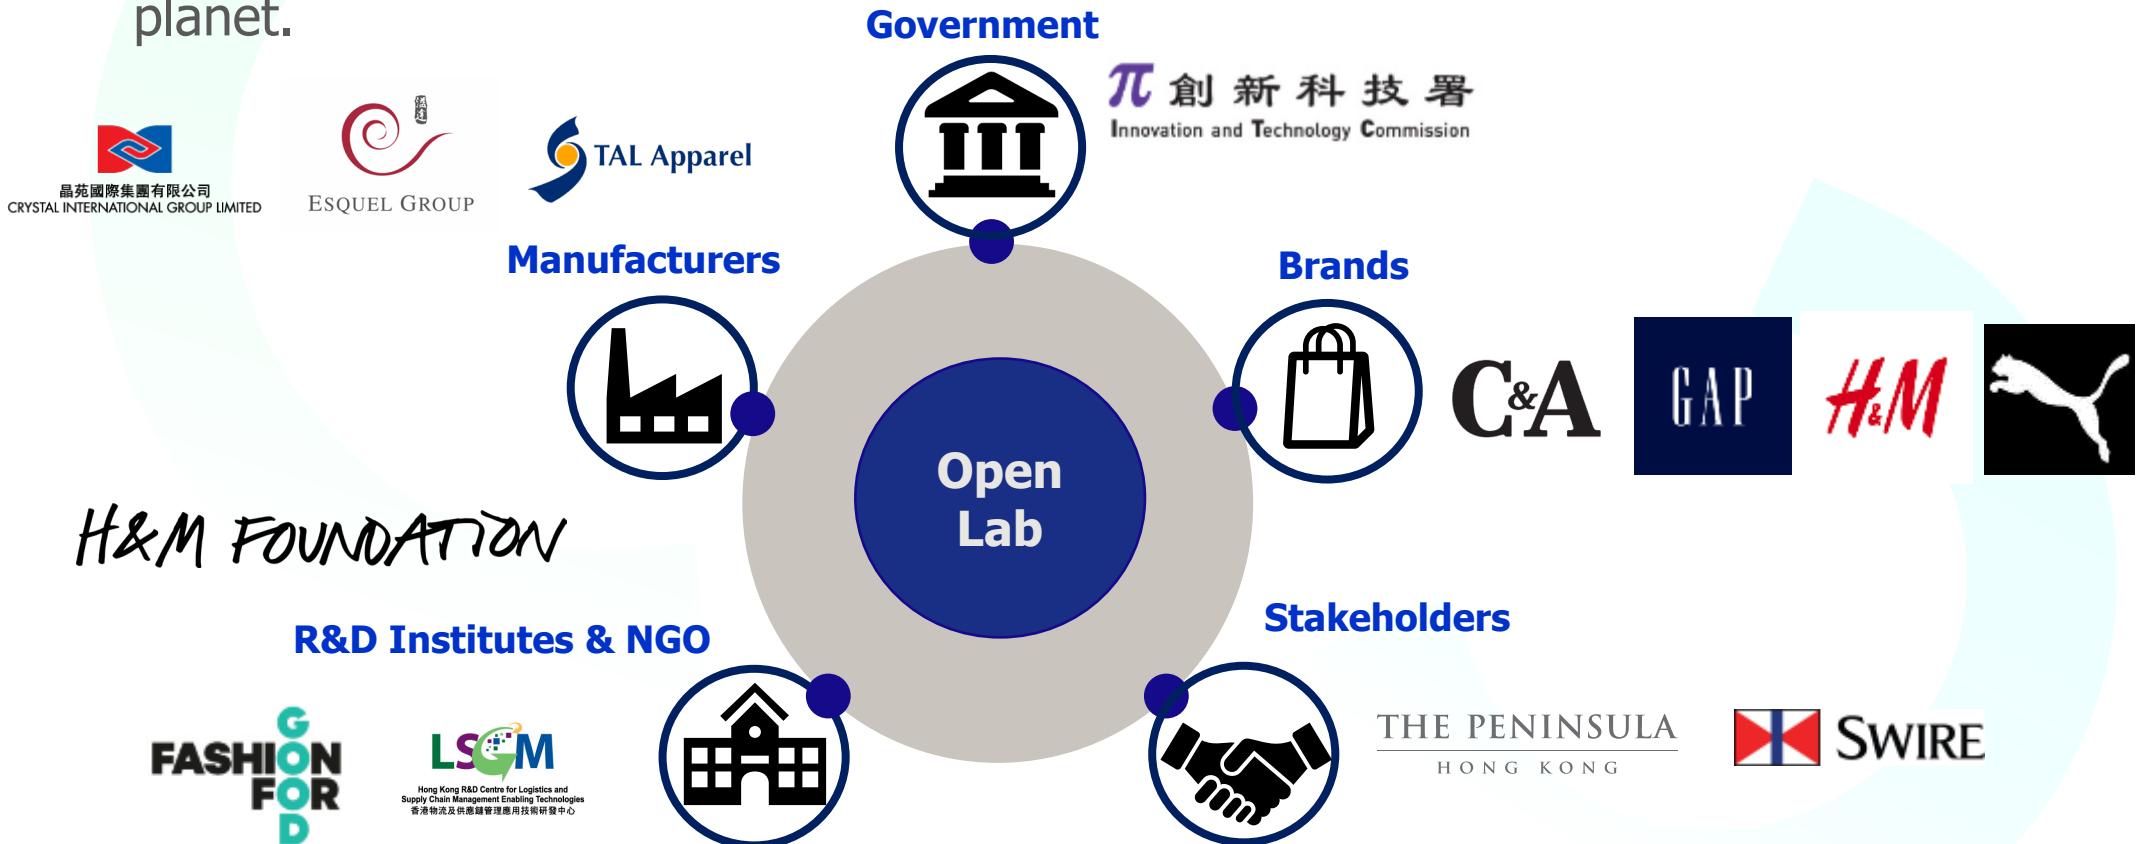

**Sustainability Projects**

- Smart Garment Sorting for Recycling →
- Green Machine: Post-consumer Blended Textile Separation and Recycling by Hydrothermal Treatment Phase II →
- Absorbout: Cellulose Superabsorbent Polymer (C-SAP) (Pilot Scale System) →
- A Novel Method and System for Decarbonisation of PET

# Open Lab: a Platform for Partnership

→ this innovative partnership is dedicated to exploring and discovering technologies that can actively contribute to building a fashion industry with a positive impact on our planet.

# Open Lab: Resources to Solve Problems

A focal point to deliver effective solutions

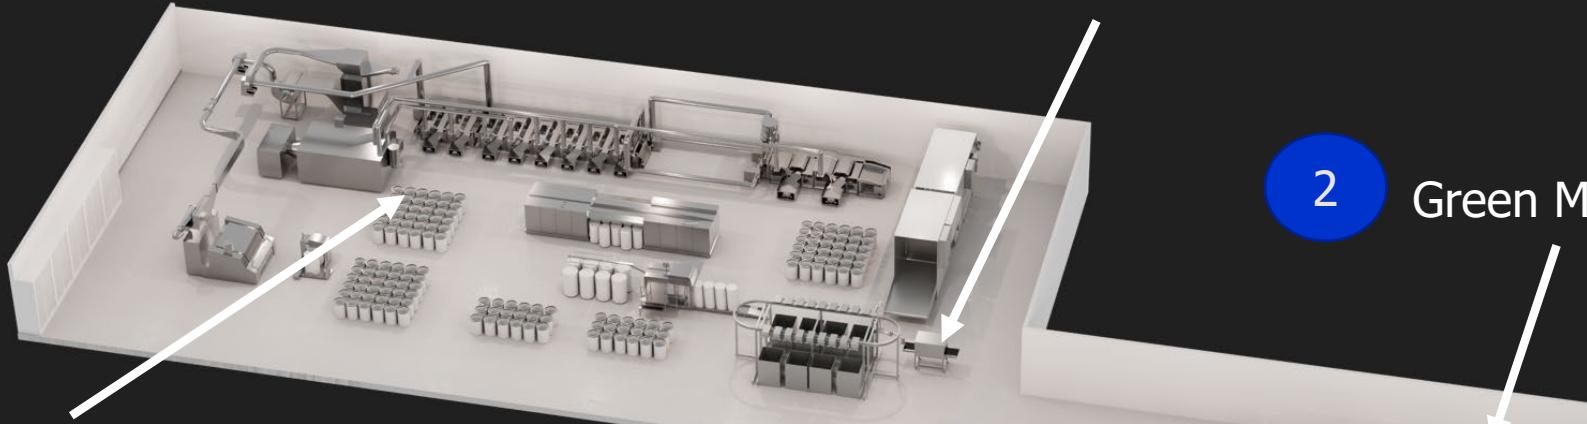

Integrate various resource including production facility, research execution and funding

Consultative support by scientists on specific questions from partners

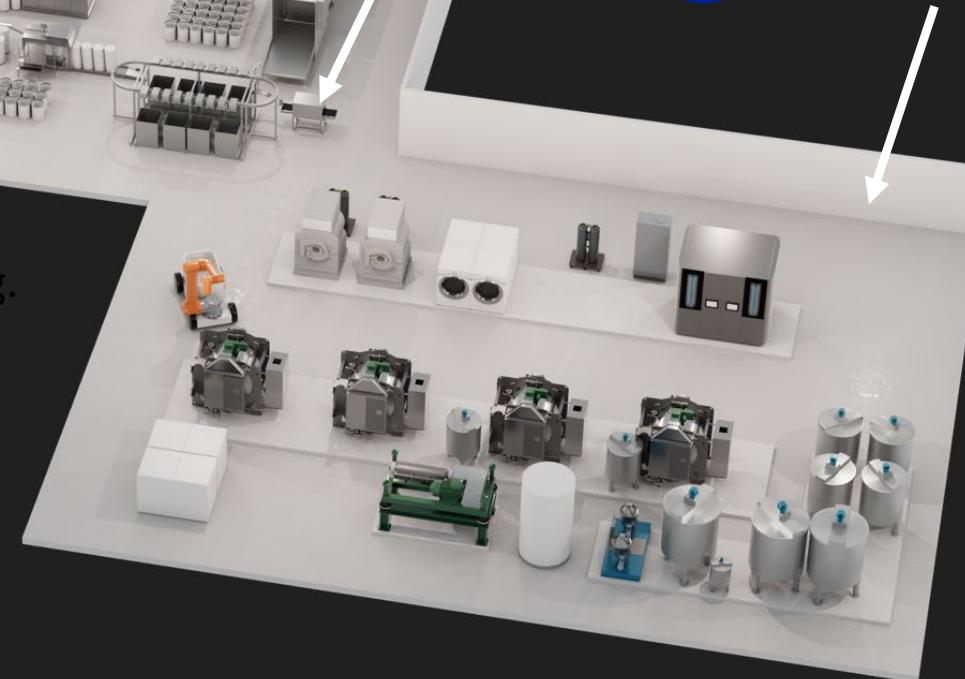

Provide knowhow on circularity, recycling, new materials, new chemistry, separation LCA etc, for textile industry

# Open Lab: Scaling Existing Solutions Pilot Plant - First End-to-End Blended Textile Upcycling in Hong Kong

1 Smart Garment Sorting System

2 Green Machine 2.0

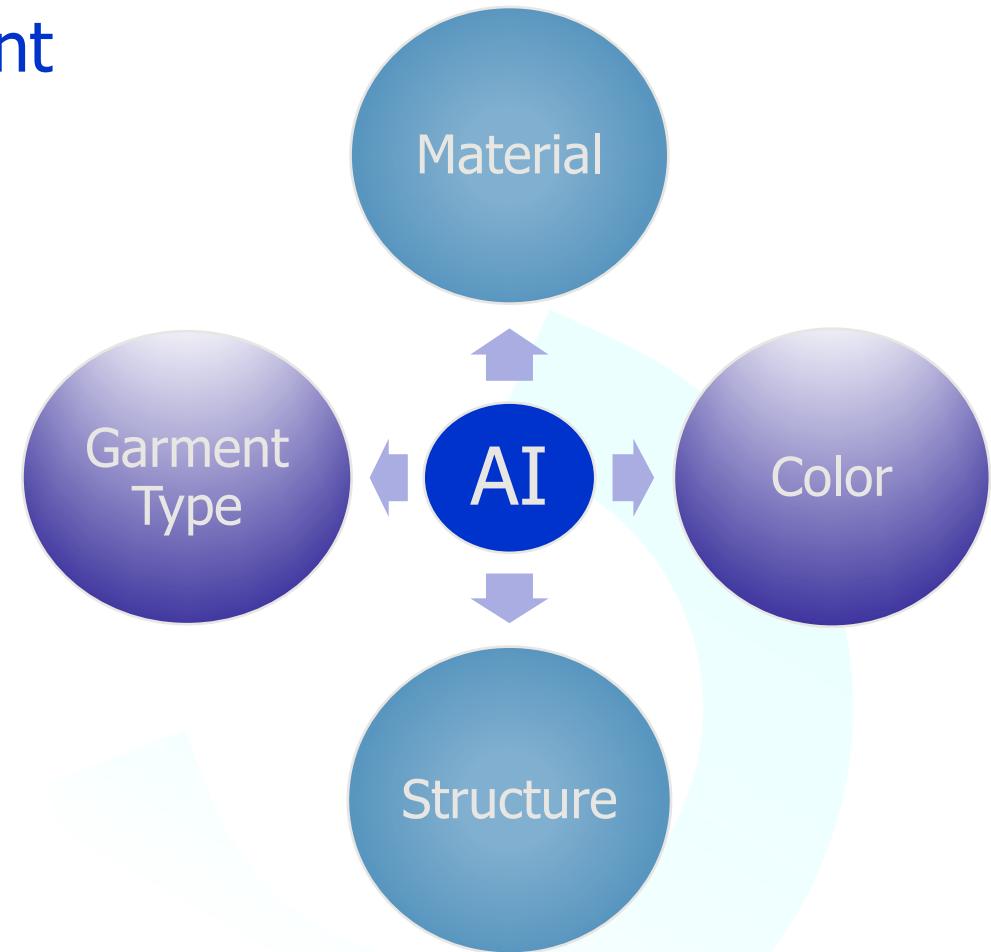

3 Advanced apparel to yarn  
processing textiles manufacturing.

# Open Lab: Scaling Existing Solutions

## Pilot Plant – AI-powered Smart Garment Sorting for Recycling

- an automated garment sorting system will be developed to replace labor-intensive and hazardous processes in garment recycling. The system will sort garments from local partners, allowing reusable items to be identified and separated for resale. PET-cotton garments can then be directed to the PET-cotton blended textile upcycling system.

## Continuous Performance improvement with AI

# Open Lab: Scaling Existing Solutions

## Pilot Plant – Green Machine 2.0

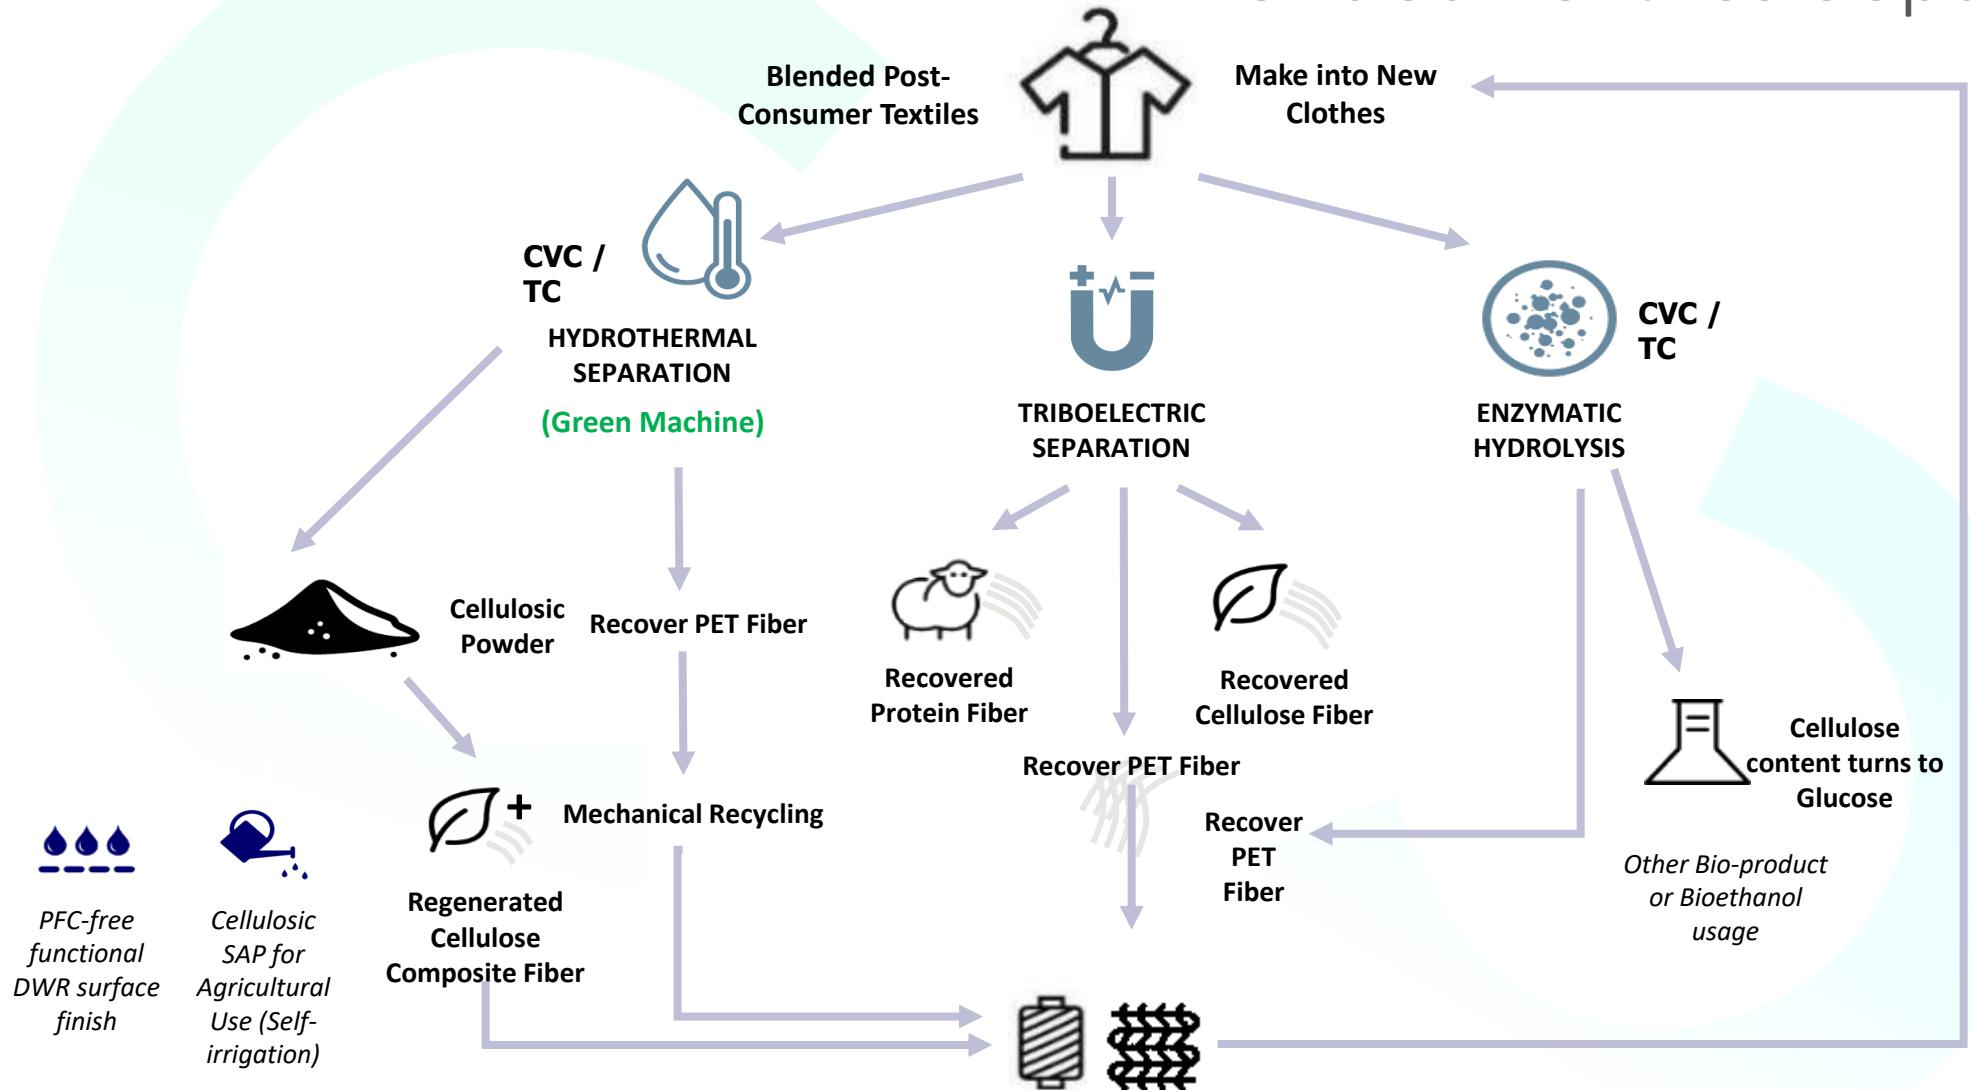

- New technologies at industrial scale.
- demonstrate our flagship technology, Green Machine, at scale – to separate and recycle waste from PET-cotton blends, transforming them into new products.
- autonomous robotic system for material handling.
- Heat and wastewater recovery systems
- Microplastic and other pollutant separation using “Accousweep” system

**OUR GOAL: reduced energy use, zero discharge**

# HKRITA – Textile Recycling Technologies

## Blended Textiles Separation

Made into Yarn & Fabric

# Cellulosic Superabsorbent Polymer (SAP)

Turning the cellulose powder recovered into superabsorbent polymer (SAP) to be used as a biodegradable, water retaining aid for cotton plantation.

- SAP made from cellulosic powder is with liquid absorption capacity 31.4 (g saline solution material) and liquid retention capacity 26.6 (g saline solution/ g material)
- Preliminary experiment shows higher growth rate and yield for cotton plant with SAP applied without additional irrigation
- Introducing fertilizer (NPK) into the cellulosic SAP - fertilizer will be released with water for better yield

# Open Lab: Inspire to Impact

## Fashion Future Lab

- a dynamic space showcasing emerging and forward-thinking ideas from researchers, partners, research institutes, start-ups and NGOs
- the future showcase encompasses emerging innovations like bio-material and microplastic management, and is open to collaboration
- initial showcase will feature the concept of “Farm-to-Garment” through innovative technology, showcasing a location-independent supply chain, where cotton will be grown, spun into yarn and further produced into garment.
